

Full System Test Report

تقرير الاختبار الشامل للنظام

فحص شامل لكل أجزاء النظام النهاردة: Dashboard, Customers, Tickets, Logs, Owner Chat, Admin pages
تسع مشاكل حقيقية اتلاقت واتصلحت فوراً.

Bugs found and fixed today

المشاكل اللي اتلاقت واتصلحت

FIXED

Owner Chat sync missing raw metrics

AiOwnerChatDTOs.cs / BusinessReportGenerationService.cs -- sync call only sent the AI's narrative report, not the real menu/order/ticket data.

Added Metrics field to the sync payload so Owner Chat can answer precise questions (menu prices, order counts) using real data.

FIXED

Customers page always showed 0 orders and 0 tickets

CustomerRepository.GetByBusinessIdAsync -- Orders/Tickets navigation properties were never eager-loaded from the database.

Added .Include(c => c.Orders).Include(c => c.Tickets) so real counts are returned.

FIXED

Customers page frontend ignored the real order count

CustomersPage.jsx -- read c.orders?.length (a field that doesn't exist in the API response) instead of c.totalOrders (the real field the backend sends).

Fixed the mapping to read c.totalOrders directly.

FIXED

Escalated tickets silently downgraded to Open

TicketsPage.jsx -- every ticket with status 'Escalated' was being rewritten to 'Open' right when data was mapped from the API.

Removed the collapse; Escalated tickets now keep their real status and render with the existing red badge styling.

FIXED

Escalated filter option missing from Tickets page

TicketsPage.jsx -- the STATUSES filter array only had Open/InProgress/Closed, no way to filter by Escalated specifically.

Added 'Escalated' to the filter list.

FIXED

Logs page 'Escalated' stat card always showed 0

LogsPage.jsx -- read escalation status from Interaction.status, but that field is only ever 'Open'/'Closed' on the backend -- it never carries 'Escalated'.

Now cross-references the Tickets list via Ticket.interactionId (reliably populated on 100% of tickets) to correctly detect escalated sessions.

FIXED**Orders showed generic 'Various items' instead of real menu items**

OrderRepository.GetByBusinessIdAsync/GetByCustomerIdAsync -- OrderItems, MenuItem, Customer, and Business navigation properties were never eager-loaded.

Added proper .Include()/ThenInclude() chains -- orders now show real item names, prices, customer names, and business names.

FIXED**Voice AI HTTP calls could hang up to 100 seconds**

Program.cs -- the 'VoiceKnowledgeSync' HttpClient had no configured Timeout, so an unreachable Voice AI (common -- it's on a private LAN IP) could stall requests for the full .NET default of 100s.

Set an explicit 5-second timeout so unreachable Voice AI fails fast instead of hanging the request pipeline.

Verified working correctly (not bugs)

اتأكد إنها شغالة صح (مش مشاكل)

- Dashboard analytics (revenue, interactions, average order value, new customers) -- all numbers cross-checked against raw Order/Ticket/Interaction data and matched.
- customerLeads 'Total Spend' showing 0 for customers with Pending orders -- correct by design, only Paid/Delivered orders count as realized revenue.
- Admin Dashboard, Businesses, and Subscriptions pages -- all load real data correctly, role-based redirect (Admin vs Owner) works as intended.
- Owner Chat -- verified live with a 5-question scenario (menu, orders, best-sellers, tickets, FAQ), all answered correctly with real data and 'high' confidence.
- AI report generation with the new extended schema -- confirmed working end-to-end after the AI team applied their fix.

Worth investigating further (not fixed yet)

يستاهل نتفحصه أكثر

BBQ Burger price/description questions fail in Owner Chat

All other menu items answer correctly for price and description, but 'BBQ Burger' specifically returns the low-confidence fallback every time. Likely its Price or Description field is empty/zero in the real database -- worth checking on the Menu page.

AI report narrative doesn't automatically mention the new metrics

The generated report's summary/highlights are built mainly from conversation analysis (intents/topics/complaints), not from the new operational metrics (orders, tickets, top-sellers) -- those are only surfaced when the owner asks Owner Chat directly. This is expected behavior, not a bug, but could be requested as an AI-team enhancement if you want the report document itself to always cite these numbers.

Suggested improvements going forward

توصيات للتحسين

- راجعي بيانات صنف BBQ Burger في صفحة المنيو -- على الأغلب السعر أو الوصف فاضي.
- لو عابزة التقرير النصي يذكر الأرقام التشغيلية (أوردرات، أكثر الأصناف مبيعا) دايما، ده طلب منفصل لفريق الـ AI يعدلوا الـ prompt بتاع كتابة التقرير.
- فيه نمط تكرر اليوم أكثر من مرة: eager-loading ناقص لعلاقات EF Core (Customer.Orders للتأكد repositories (Ticket, Feedback, Interaction) يستاهل مراجعة سريعة لباقي الـ Order.OrderItems). مفيش نفس المشكلة مخبية في مكان تاني.
- جرس الإشعارات في الـ Topbar بيعمل polling كل 15 ثانية -- الكود عنده حماية صحيحة تمنعه للأدمن (لا يوجد businessId)، لكن يستاهل تأكيد إضافي إن الحماية دي بتشتغل فوريا بعد تسجيل الدخول مباشرة مش بعد أول محاولة فاشلة.
